

Installation Instructions MAGNUM GRIP PRO STICK SHIFTER

Fits: Vehicles with GM TH-400, 350, 250, 200 700R4
200-4R, 4L80E & 4L85E Transmission
Catalog # 81052

WORK SAFELY! For maximum safety, perform this installation on a clean, level surface and with the engine turned off. Place blocks or wedges in front of and behind both rear wheels to prevent movement in either direction.

CAUTION: To avoid any possibility of bodily injury or damage to vehicle, do not attempt installation until you are confident that the vehicle is safely secured and will not move.

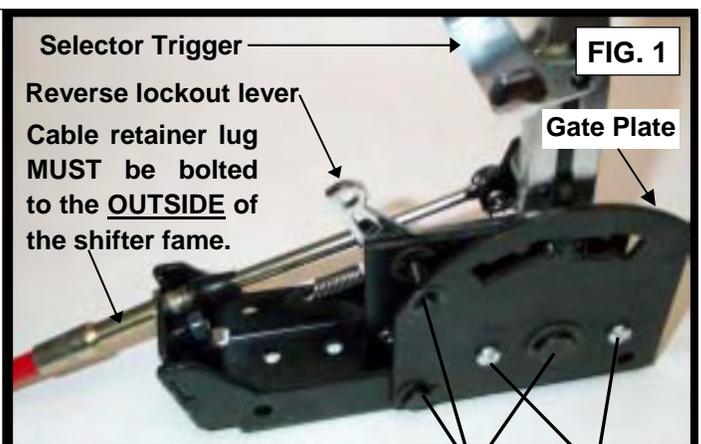

The Magnum Grip Pro Stick comes equipped with a three speed forward (standard) pattern gate that works with most popular three speed automatic transmissions. To use these shifters with a reverse pattern three speed automatic transmission or a two speed automatic transmission you will need an optional gate plate.

An aluminum mounting bracket is available for the **B&M Magnum Grip Pro Stick** shifter with quick release pins to allow the shifter to be removed and replaced quickly, or the shifter can be mounted directly to the floor. The housing can be used either with or without the mounting bracket. The shifter comes equipped with a neutral safety switch, and an optional backup light switch is available. The housing may easily be trimmed and modified to fit.

WARNING: If your vehicle is equipped with a locking steering column, securing the column lock lever in the engine compartment in the full up position will allow the wheel to lock and unlock but will allow the key to lock the wheel if the key is turned to “lock” while moving, or at any time. Securing the lock lever in any other position will prevent the wheel from locking at any time.

If you are going to use a gate plate on the shifter, change it now. Remove the two screws and three “E” rings that hold the gate plate on (See Figure #1). Remove the original gate plate and install the new gate plate. Replace the “E” rings and the screws.

NOTE: To use the **B&M Pro Stick** with a GM 4L80E or 4L85E transmission equipped with a PRNDL switch you will need the optional accessory kit #75498, otherwise you can use the GM bracket supplied.

To change gate plate, remove “e” rings and 2 screws

1. Remove the stock shift linkage:

Column Shifters: Remove all rods, levers or cables from the column and the transmission. Place the column shifter lever in the park position. Remove the roll pin holding the shift lever to the column and remove the shift lever assembly.

Console Shifters: Remove the shifter mechanism from the console. Disconnect and remove the rod or cable from the transmission if so equipped.

Note: Shifter installation may require console modification or complete console removal depending on your vehicle and available space.

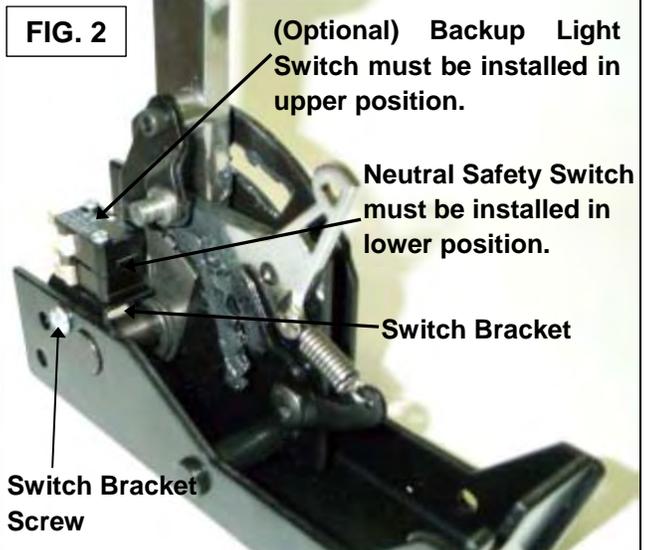

2. If so equipped, pull the carpet away from the floorboard where the shifter is to be mounted. Locate the shifter in the vehicle with the stick shifted to the rearmost gate position and mark the position of the four mounting holes in the floor.

3. Remove the shifter mechanism and drill four mounting holes using a 9/32" drill bit. Mark the position of the shifter cable hole. The cable hole must be 1 inch in diameter. Drill or cut the cable hole in the floorboard.

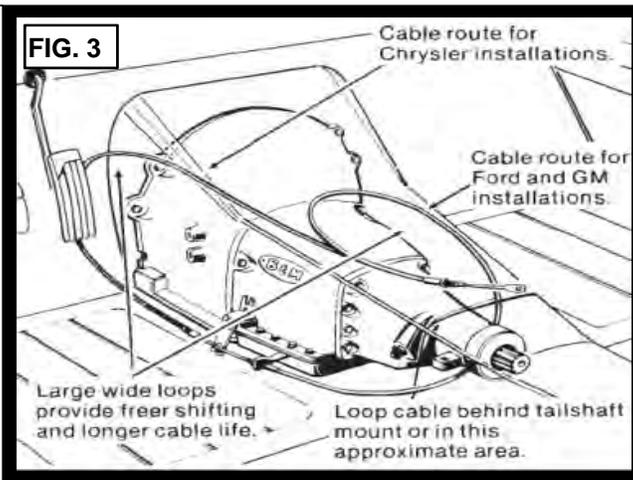

4. Install the carpet back to the original position. Do not secure the carpet at this time. Cut holes in the carpet at the mounting hole position. Cut a 1 inch slit in the carpet at the cable hole position.

5. Install the cable onto the shifter mechanism. One end of the cable has a threaded housing and a threaded cable end. This is the transmission end of the cable. The other end of the cable has a flat cable end with a hole. Fit the cable housing into the U-shaped notch in the shifter mechanism and fasten the retainer lug with the supplied 1/4" - 20x1/2" bolt, lockwasher and nut to the outside of the shifter frame. (See Figure #1 above) Install the "E" ring to retain the cable. Use cable clamps or tie-wraps to secure the cable to avoid contact with hot engine or exhaust system.

6. Install the neutral safety switch in place on the switch bracket (See Figure #2). Install two #4-40 x 5/8" screws through the switch and the bracket. Install a lockwasher and a nut on each screw and tighten snugly. Do not overtighten the nuts as you may crack the switch. Install the switch bracket assembly on the shifter base with a 10-24 x 1/2" pan head screw. If required, you can adjust the switch relative to the switch actuator plate.

7. Install the shifter mechanism into the vehicle. Slide the shifter cable through the carpet and the cable hole in the floor. The shifter mechanism should be level when installed. Make sure the cable is routed according to Figure #3 to avoid sharp bends or damage to the cable. Install the 1/4" -20x1-1/2" bolts, washers, and nuts (supplied) through the shifter and the floorboard and tighten securely.

Note: Some floorboards are extremely thin and will not adequately support the shifter mechanism when bolted to the floor, resulting in excessive shifter wobble. For those vehicles, we recommend you fabricate a stiffener plate for additional strength. Seal the cable hole securely to prevent entry of exhaust gases.

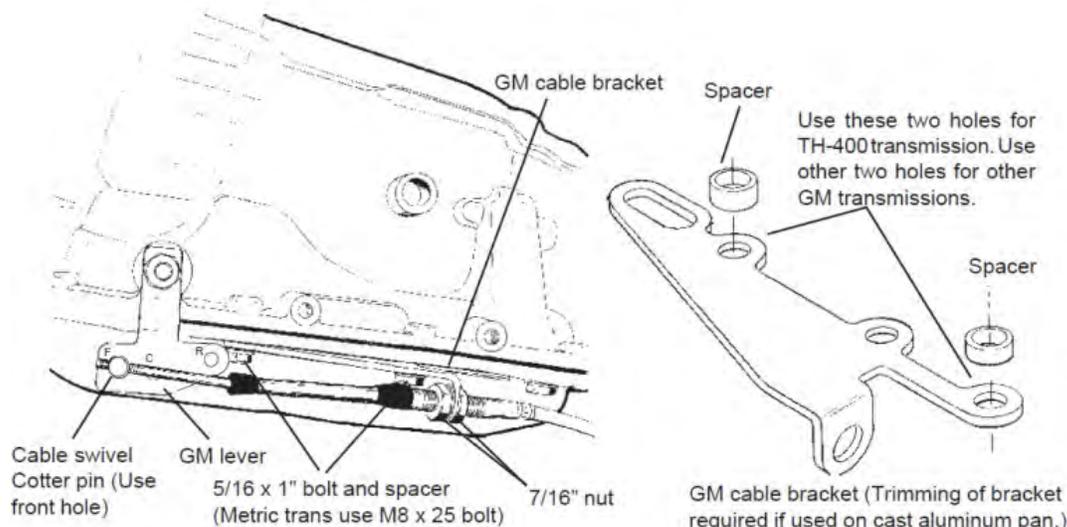

GENERAL MOTORS

8. If you have not already done so, remove the stock selector lever nut and the selector lever from the transmission. Discard the stock lever and the stock shifter linkage. Install the B&M selector lever in position using the stock selector lever nut (See Figure #4). Torque the nut to 23ft.lbs. The lever should move smoothly from front to rear with a positive click in each gear position.

9. Remove the two transmission oil pan bolts from the middle of the left side of the oil pan. Install the cable bracket in position (See Figure #4). The bracket must be installed with two spacers between the pan and the bracket. (If the transmission is equipped with a cast aluminum oil pan, these spacers should be omitted. If it is a TH-400 with a cast aluminum oil pan, the cable bracket may have to be modified.) Install the two 5/16-18 x 1.00" bolts (Metric transmissions use the two 8mm x 25mm bolts) supplied and tighten 12-13 lbs.ft. Do not overtighten as this can damage the pan gasket.

Note: In some cases possible modification to the GM cable bracket might be required for the 4L80E and 4L85E transmissions without the PRNDL switch. Verify that selector lever does not grind on cable bracket before moving on to step 10.

FIG. 4

10. Route the shifter cable according to Figure #3. Avoid kinks and sharp bends and route the cable away from hot engine or exhaust parts. Remove the two rubber boots, one large nut, and a large lockwasher from the threaded end of the shifter cable. Slide the end of the cable into the cable bracket, install the large nut and the lockwasher loosely over the end of the cable. Install the two rubber boots onto the end of the cable. Install the swivel on the threaded end of the cable and position it in the center of the threaded portion.

11. Move the transmission selector lever by hand to the full rear position (Low). Operate the shifter lever to the Low gear position (all the way back). Adjust the large nuts on the cable so that the swivel will slide into the front hole on the selector lever. Tighten the large nuts completely. Be sure that the swivel will slide freely in and out of the hole in the selector lever.

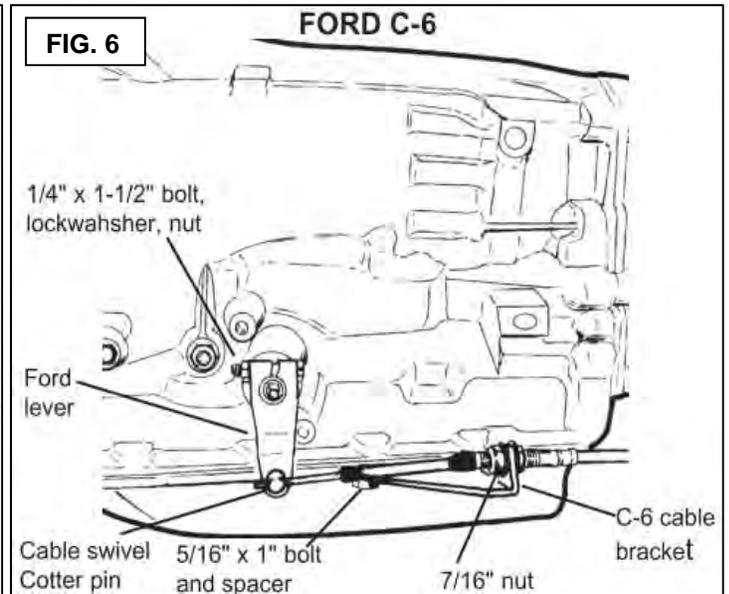

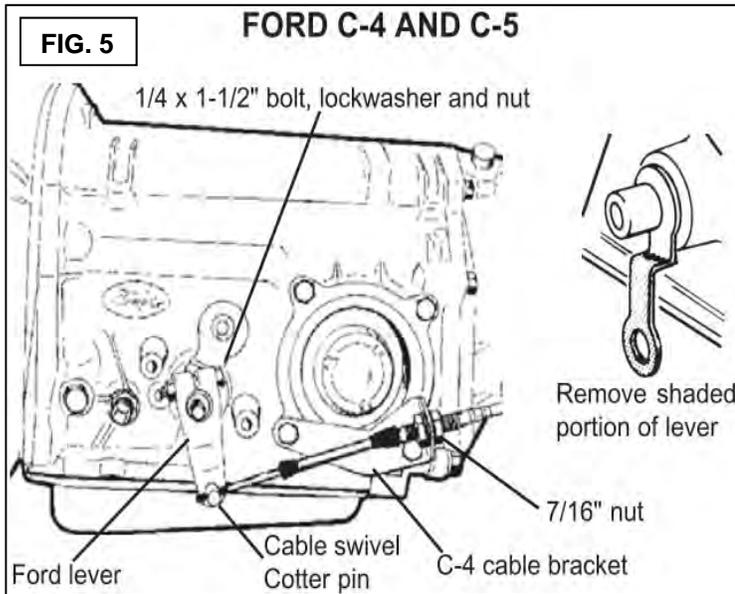

Note: The shifter will not operate correctly unless the front hole in the shift lever is used. Leave the swivel out of the hole and move the selector lever to Park, all the way forward. Also move the shifter to the Park position (all the way forward). Reinsert the swivel into the front hole in the selector lever. Check to see that the swivel will slide freely in and out of the front hole in the selector lever in this position. If it does not slip in freely, adjust the swivel slightly until it will slip into the hole in the lever. Move the shifter back to the Low gear position and check that the swivel will still slide easily in and out of the front hole in the selector level. (If you do not use the front hole in the lever, it will be impossible to correctly adjust the cable.) Operate the shifter through all the gear positions. Check to make sure the swivel will slide in and out of the front selector lever hole in each gear position. The shift cable is now correctly adjusted. Install the cotter key supplied with the shifter into the swivel and spread the key ends. If you have a problem, **DO NOT FORCE THE SHIFTER**, this will damage the cable, the shifter or the transmission. Simply start at the beginning and carefully check all your steps.

12. On GM vehicles the neutral safety switch may be located on the shifter (steering column or console), or it may be a mechanical interlock in the steering column that prevents the key from turning to the Start position unless the shifter is in the Park or Neutral position. Identify the type of neutral safety system you have. If the key will not turn to the Start position unless the stock shifter is in Park or Neutral, you have a mechanical interlock type, otherwise you have a neutral safety switch type. If you have a neutral safety switch, locate the switch and identify the neutral safety wires (engine will not crank unless these wires are connected together). With either type, disconnect the battery ground cable to prevent accidental shorts. If you have a neutral safety switch, disconnect and extend both wires from the GM switch to the switch on the shifter. If you have a mechanical interlock cut the wire that goes from the Start position on the ignition switch to the solenoid on the starter. This wire is usually a 10 or 12 gauge purple wire. Run wires from both ends of the cut wire to the switch on the shifter. Put slip on terminals on the ends of the lengthened wire. Crimp the terminals onto the wires using a crimping tool or pliers. Connect the wires to the switch on the shifter. Tape the terminal connections and all other connections to prevent shorts. Reconnect the battery ground cable, disconnect the coil wire and set the parking brake. Check the switch operation by attempting to start the motor in each shifter position. The starter must crank only when the shifter is in the Park or Neutral position. Adjust the switch if required. Reconnect the coil wire.

FORD

13. If you have not already done so, remove the nut and lockwasher holding the downshift linkage onto the downshift lever shaft. The downshift lever is the outer lever on C-4, C-5, C-6 and AOD transmissions. Pull the lever off the shaft and allow the linkage to hang free. Remove and discard the stock shift linkage rods. Some C-6 and all (late) C-4 and C-5 transmissions have a neutral safety/backup light switch on the transmission shift lever. If your transmission is so equipped, remove the two bolts holding the switch in place and slide it off the shift shaft. Disconnect the switch at the factory plug and discard it.

14. Install the B&M selector lever (See Figure #5 or #6). Note: The B&M lever must point downward for proper operation. If the stock shift lever on your transmission points down, you will have to remove the lower part of the stock arm by cutting it off to clear the B&M lever (See Figure #5). Install the B&M selector lever onto the shift shaft of the transmission. Align the selector lever so when it points straight down it travels equal arcs in both directions from the center, then tighten the 1/4"-20 x 1 1/2" pinch bolt and nut. The lever should travel smoothly from front to back with a positive click in each gear position. Make sure the O-ring is in position on the downshift shaft and install the downshift lever in position on the shaft. Install the lockwasher and nut and tighten securely. The downshift lever must operate smoothly. Reconnect the downshift linkage.

15. Cable bracket installation:

AOD: Instructions for the AOD are included with the optional installation kit, Part #40496. C-4, C-5: Remove the two lower bolts from the rear servo cover. Install the cable bracket in position (See Figure #5). Install the two servo cover bolts as removed and tighten 12-13 lbs.ft. Do not overtighten as this can distort the servo cover. C-6: Remove the two transmission oil pan bolts from the left rear corner of the oil pan. Install the cable bracket in position with two spacers between the pan and the bracket. (If your transmission is equipped with a cast aluminum oil pan, these spacers can be omitted.) Install the two 5/16-18 x 1.00" bolts supplied and tighten 12-13 lbs.ft. Do not overtighten as this can damage the pan gasket.

16. Route the shifter cable according to Figure #3. Avoid kinks and sharp bends and route the cable away from hot engine or exhaust parts.

Remove the two rubber boots, one large nut, and a large lockwasher from the threaded end of the shifter cable. Slide the end of the cable into the cable bracket, install the large nut and lockwasher loosely over the end of the cable. Install the two rubber boots onto the end of the cable. Install the swivel on the threaded end of the cable and position it in the center of the threaded portion.

17. Move the transmission selector lever by hand to the full rear position (Low). Place the shifter lever to the Low gear so that the swivel will slide into the hole on the selector lever. Tighten the large nuts completely. Be sure that the swivel will slide freely in and out of the hole in the selector lever. With the swivel in the selector lever, move the shifter to the Park position, as far forward as the shifter will go without forcing it. (The shifter has further travel that is used to reach the GM Park position but is not

used on the Ford transmissions. Trying to force the cable will damage the cable.) The shift lever on the transmission should be all the way forward. Check to see that the swivel will slide freely in and out of the hole in the lever in this position. If it does not slip in freely, adjust the swivel slightly until it will slip into the hole in the lever in both the Low and Park positions. Operate the shifter through all the gear positions. Check to make sure the swivel will slide in and out of the selector lever hole in each gear position. Install the cotter key supplied with the shifter into the swivel and spread the key ends.

If you have a problem, DO NOT FORCE THE SHIFTER, this will damage the cable, the shifter or the transmission. Simply start at the beginning and carefully check all your steps.

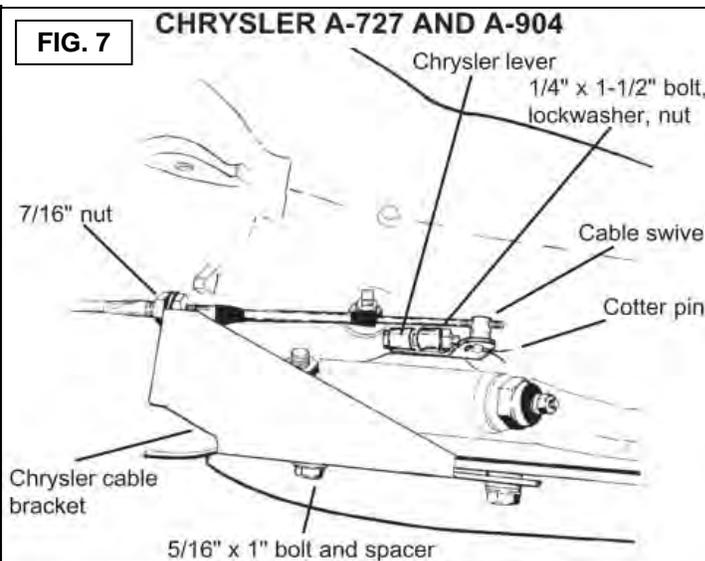

IMPORTANT: Do not force the shifter to over-travel into the Park position. This will move the shifter into the GM Park position and will damage the cable or transmission.

18. On Ford vehicles, the neutral safety/backup light switch is located on the transmission (or on the steering column on some early vehicles). If the vehicle has an AOD transmission the neutral safety/backup light switches on the B&M Magnum Grip Pro Stick shifter will NOT be used. The neutral safety/backup light switch on the AOD transmissions will continue to function normally.

On the C-4 and C-5 transmissions it is necessary to completely remove the stock neutral safety/backup light switch in order to install the B&M transmission shift lever. On C-4, C-5 and C-6 transmissions, it will be necessary to hook up the neutral safety/backup light switches on the B&M Magnum Grip Pro Stick shifter. Locate and identify the neutral safety (the engine will not crank unless these wires are connected together), and reverse light wires. Disconnect the battery ground cable before beginning to wire the neutral safety and reverse light switches. Reroute the wires to the B&M Magnum Grip Pro Stick shifter. Strip 1/4" insulation off the wires and install the supplied slip on terminals. Crimp the terminals onto the wires to the LOWER switch and the reverse light wires to the UPPER switch (See Figure #1). Tape the terminal connections to prevent shorts. Reconnect the battery ground cable, disconnect the coil wire and set the parking brake. Check the switch operation by attempting to start the motor in each shifter position. The starter must crank only when the shifter is in the Park or Neutral position. Check the backup light operation when the shifter is shifted to the Reverse position. Adjust the switches if required. Reconnect the coil wire.

CHRYSLER

19. If you have not already done so, loosen the pinch bolt on the throttle lever on the transmission. This is the lever on the small diameter shaft. Pry the lever off with a screwdriver and allow the linkage to hang free. Remove and discard the stock shift lever and tighten the pinch bolt securely (See Figure #7). Make sure the lever is not pushed down so far as to touch the transmission, it should travel smoothly from front to back with a positive click in each gear position. Install the stock throttle lever in position on the small diameter shaft as removed and tighten the pinch bolt securely. The throttle lever must operate smoothly.

20. Remove the two transmission oil pan bolts directly below the shift lever. Install the cable bracket in position (See Figure #7) with two spacers between the pan and the bracket. (If your transmission is

equipped with a cast aluminum oil pan these spacers can be omitted.) Install the two 5/16-18 x 1.00" pan bolts supplied and tighten to 12-13 lbs.ft. Do not overtighten as this can damage the pan gasket.

21. Route the shifter cable according to Figure #3. Avoid kinks and sharp bends and route the cable away from hot engine or exhaust parts.

Remove the two rubber boots, one large nut, and a large lockwasher from the threaded end of the shifter cable. Slide the end of the cable into the cable bracket, install the large nut and lockwasher loosely over the end of the cable. Install the two rubber boots onto the end of the cable. Install the swivel on the threaded end of the cable and position it in the center of the threaded portion.

22. Move the transmission selector lever by hand to full forward position (Low). Place the shifter lever to the Low gear position (all the way back). Adjust the large nuts on the cable so that the swivel will slide into the hole on the selector lever. Tighten the large nuts completely. Be sure that the swivel will slide freely in and out of the hole in the selector lever.

With the swivel in the selector lever, move the shifter to the Park position, as far forward as the shifter will go without forcing it. (The shifter has further travel that is used to reaching the GM Park position but is not used on the Chrysler transmissions. Trying to force the shifter will damage the cable.) The shift lever on the transmission should be all the way back. Check to see that the swivel will slide freely in and out of the hole in the lever in this position. If it does not slip in freely, adjust the swivel slightly until it will slip into the hole in the lever in both the Low and Park positions. Operate the shifter through all the gear positions. Check to make sure the swivel will slide in and out of the selector lever hole in each gear position. Install the cotter key supplied with the shifter into the swivel and spread the key ends.

If you have a problem DO NOT FORCE THE SHIFTER, this will damage the cable, the shifter, or the transmission. Simply start at the beginning and carefully check all your steps.

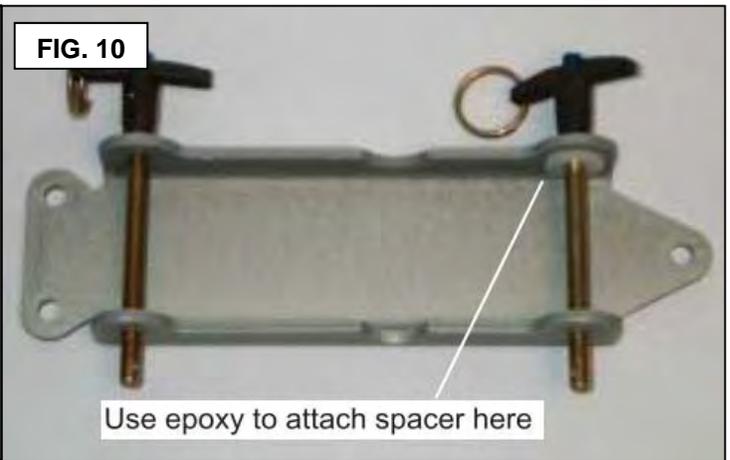

Important: Do not force the shifter to over-travel into the Park position. This will move the shifter into the GM Park position and will damage the cable or transmission.

23. Check the operation of throttle linkage again. The linkage must operate smoothly with no bind. All transmissions using automatic valve bodies must have the throttle linkage connected and operating or transmission damage will result.

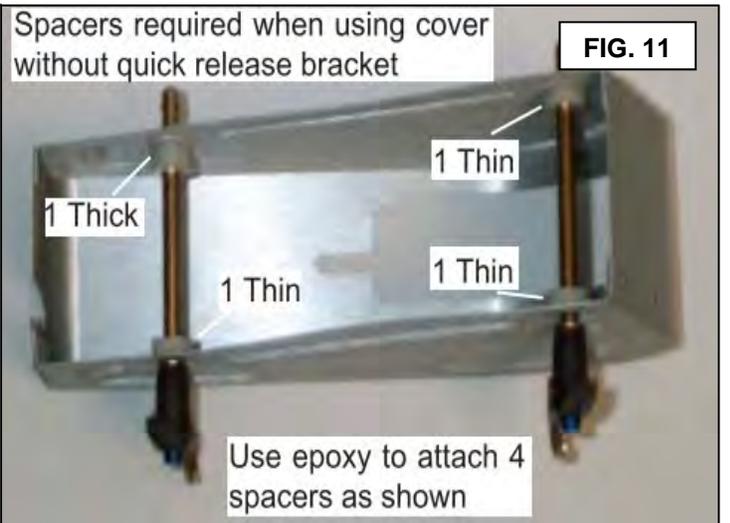

24. Neutral safety/backup light switch 66-68: The neutral safety switch will continue to function normally. It will not be necessary to hook up the neutral safety switch wires on the shifter. Disconnect the battery ground cable before wiring the backup light switch. Locate the original backup light switch on the steering column or console shifter. Run these wires to the top switch on the B&M Magnum Grip Pro Stick. Reconnect the ground wire and check the light for proper operation. Adjust the switches on the shifter if required. 69 and Later: The neutral safety/backup switch is located on the transmission and will continue to function normally. It will not be necessary to connect any wires to the switches on the shifter.

MOUNTING BRACKET AND ALUMINUM HOUSING

If the quick release mounting bracket is being used, it is screwed to the floor with four mounting screws. One spacer washer is required between the mounting bracket and the shifter in the location shown in Figure #10. The shifter is held onto the bracket with the two quick release pins.

The aluminum housing can be used with or without the mounting bracket. If it is used with the mounting bracket, no spacers are required. If it is used without the mounting bracket, four spacer washers are required between the shifter and the cover as shown in Figure #11. The two quick release pins are used to hold the cover to the shifter or the shifter and mounting bracket. A sheet of shift pattern decals is included with the cover. Select the one that fits your shift pattern and press the decal on the top of the housing to line up with the stick.

OPERATION

How to shift Magnum Grip Pro Stick Shifter

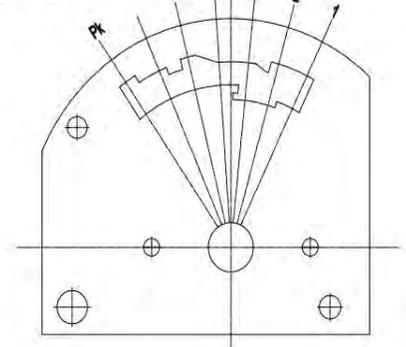

Note: The Reverse Lockout Lever (See Figure #1) described in the following instructions ONLY needs to be operated when shifting from Neutral to Reverse.

THREE SPEED FORWARD PATTERN (SEE FIGURE #12)

1. First Gear: (Starting with the shifter in Park) Pull the trigger lightly until it stops, then pull the stick all the way back releasing the trigger at mid travel.
2. Second Gear: Push the stick forward to stop.
3. Third Gear: Pull and hold the trigger firmly, then push the stick forward to stop. Release the trigger and remove the pressure from the stick allowing the spring loaded selector pin to raise to the top of the gate opening.
4. Neutral: Push the stick forward to stop.
5. Reverse: Push the Reverse Lockout lever forward, then push the stick forward to stop.
6. Park: Pull and hold the trigger lightly until it stops, then while holding pressure on the trigger push the stick forward until it stops.

FIG. 12

3 Spd Std Gate

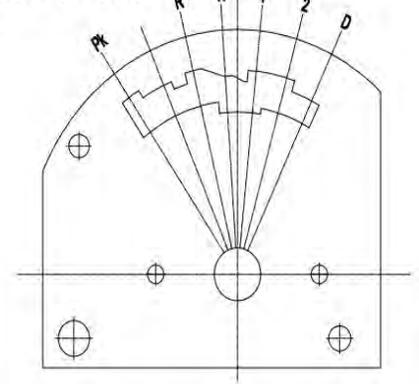

THREE SPEED REVERSE PATTERN (SEE FIGURE #13)

1. First Gear: (Starting with the shifter in Park) Pull the trigger lightly until it stops, then while holding the pressure on the trigger pull the stick rearward slowly until the stick stops at the "1" position.
2. Second Gear: Pull the stick rearward against the stop.
3. Third Gear: Pull the trigger lightly until it stops, then while holding pressure on the trigger pull the stick rearward until it stops.
4. Neutral: From Third, Second, or First. Pull the trigger lightly until it stops, then while holding pressure on the trigger push the stick forward until it stops.
5. Reverse: Push the Reverse Lockout lever forward, then push the stick forward until it stops.
6. Park: Pull the trigger lightly until it stops, then while holding pressure on the trigger push the stick forward until it stops.

FIG. 13

3 Spd Rev Gate

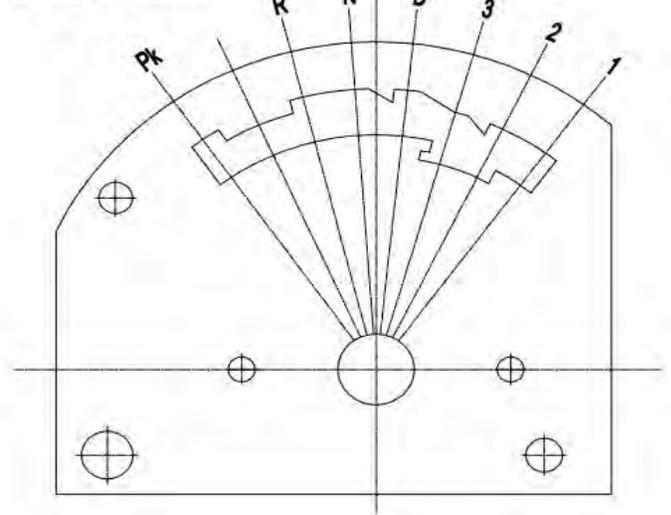

FOUR SPEED FORWARD PATTERN (SEE FIGURE #15) (Reverse pattern not available.)

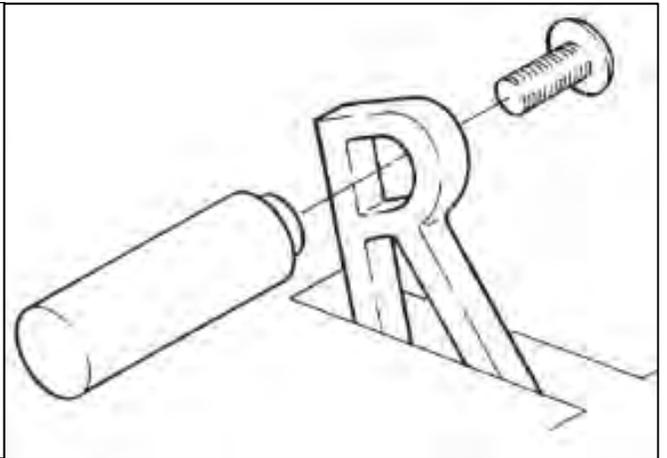

1. First Gear: (Starting with the shifter in Park) Pull the trigger lightly until it stops, then pull the stick all the way back releasing the trigger at mid travel.
2. Second Gear: Push the stick forward until it stops.
3. Third Gear: Pull and hold the trigger firmly, then push the stick forward until it stops. Release the trigger and remove pressure from the stick allowing the spring loaded selector pin to raise to the top of the gate opening.
4. Fourth Gear: Push the stick forward until it stops.
5. Neutral: Pull the trigger and push the stick forward until it stops. Release the trigger.
6. Reverse: Push the Reverse Lockout lever forward, then push the stick forward until it stops.
7. Park: Pull the trigger lightly until it stops, then while holding pressure on the trigger, push the stick forward until it stops.

FIG. 15

4 Spd Gate

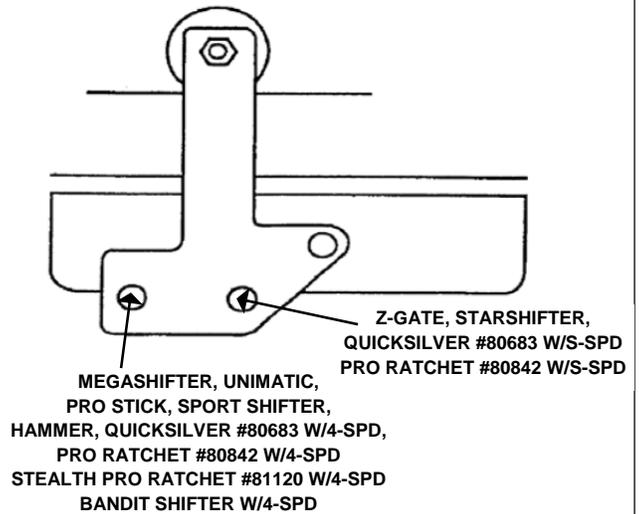

An extender handle for the reverse lockout lever is now included with the Pro Stick shifter. This handle allows easier access to the reverse lockout, particularly in a race car while wearing belts and gloves. If you wish to use this extender handle, insert the handle from the left side of the shifter through the center of the "R" of the reverse lockout lever and secure it with the screw provided. Use Loctite on the threads.

CABLE ADJUSTMENT WARNING

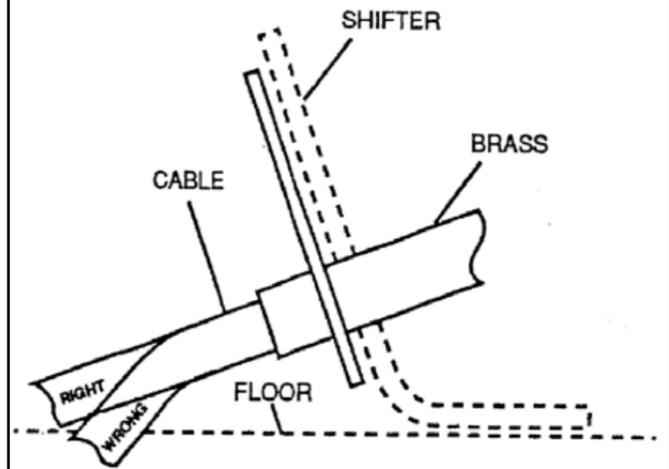

INSTALLATION

NOTE: Be careful. Select the correct hole for your shifter. Wrong hole **will** destroy the cable, shifter and/or transmission in **one** shift! (GM trans. only)

DO NOT KINK CABLE

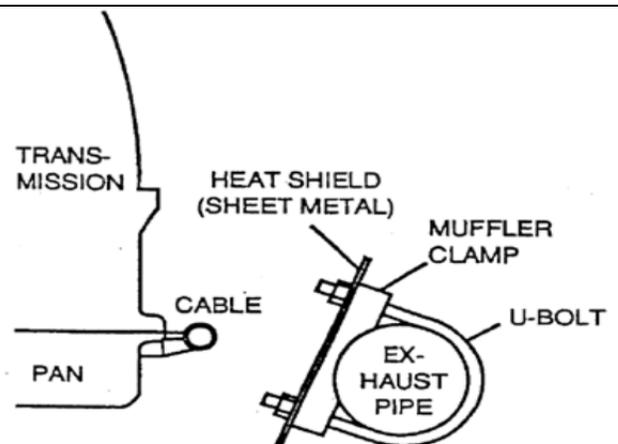

NOTE: Do not kink cable anywhere along its length. If cable has a kink, it will lock up. Cable should be kept straight for 2 inches on each end where it leaves the brass. Any of the above **will** destroy the cable, shifter and/or transmission in **one** shift!

MELTED CABLES

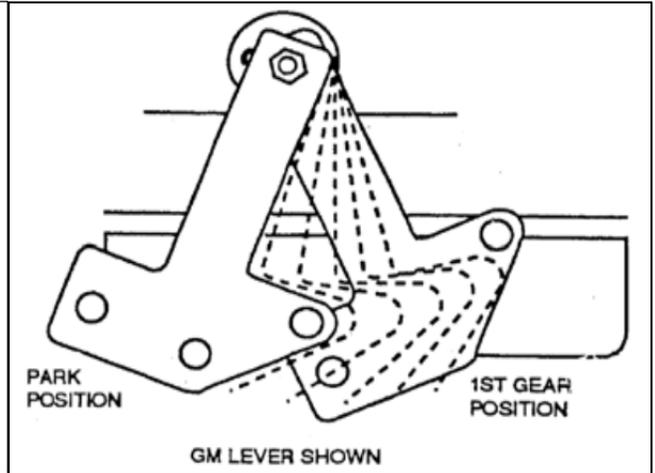

NOTE: If your cable is close to your exhaust it will melt or become brittle. If this is the case, you will need to make a heat shield.

Do not wrap the cable, this retains heat. Heat will destroy the cable!

CABLE ADJUSTMENT

NOTE: If you don't adjust the cable correctly, you **will** destroy the cable, shifter and/or transmission in **one** shift. Put the transmission in low gear and shifter in low gear, set the swivel so it slides in and out of the correct hole freely (See installation picture). Then move the transmission and shifter to park (all the way the other way) then rotate the cable swivel until it slips in and out of the hole freely. Now go back and forth between Park and low gear and fine tune the adjustment. See instructions for further details.

IMPORTANT: RETAIN THESE INSTRUCTIONS FOR FUTURE REFERENCE

Technical Service

A highly trained technical service department is maintained by Hurst Performance to answer your technical questions, provide additional product information and offer various recommendations.

Technical service calls, correspondence, and warranty questions should be directed to:
